

DRAGONBOARD- Wall & Ceiling Projects

The builder specified DragonBoard in the swimming pool area to minimize mold issues and to provide a high impact, long lasting enclosure. The entire room was first sealed with Alumiseal, a mylar/aluminum product to minimize vapor seepage to the house. One wall was installed "rough side out" to facilitate the stone & carpet application (the carpet was glued and the stone was applied similar to tile). The remainder of the walls were finished with epoxy paint because of the wet environment. The builder also utilized DragonBoard in the wood shop and garages to improve impact resistance as well as provide a two-hour firewall.
